Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Ms. Laura Williams

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Ms. susan levy

Nov 14, 2013

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

Hydrogenated or partially hydrogenated peanut butter never sounded right to me. I had learned enough chemistry to understand that the rigid hydrogen molecule that made the oil firm also prevented the human body from combining with it. In other words, there was no effective nutrition.

So I raised my children on organic, non-hydrogenated peanut butter. Was it nuts to insist on this?

No.

So I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the FDA has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually.

Back in the 60s, who knew? But, we know now.

The FDA's preliminary declaration also coincides with the Institute of Medicine's recommendation that there is NO safe level of trans fat, and that intake should be as low as possible.

Restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods. Yet, the baneful ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

Thus, I urge the FDA to notify industry that it must complete the
elimination of artificial trans fat in the next 6 to 12 months.

If a company cannot do so, it may seek an extension from the FDA. However, the prohibition on the use of partially hydrogenated oils should go into effect at once. It should not be delayed.

Thank you for considering my views.

Sincerely,
Ms. Sarah McKee

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mr. Paul Mushrush

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mr. Gil Jester

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

I believe the FDA should require companies to eliminate all transfat. The current strategy of providing information on labels has helped but allows companies to sneak in under the radar screen with less than 0.5 grams per serving, since serving size is arbitrary and people tend to eat more than one serving at one time and certainly within a short amount of time. This cut off is subject to manipulation. If it is impossible to eliminate all transfats, then can't its presence (>0) still be acknowledged? As is, the policy is simply confusing and not at all transparent to most consumers.

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,
Ms. Angela Whitley

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mr. James Teator

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mr. CHARLES BERTRAM

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe. I personally have been avoiding them for years (when I could identify them.)

As the agency has noted, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While some restaurants and food manufacturers have made progress in eliminating partially hydrogenated oils from many foods, the ingredient is still found in many prepared and restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mr. Robert Summers

Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,
Mr. Steve Kohn

Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration’s preliminary determination that partially hydrogenated oils are no longer generally recognized as safe. As a mother, grandmother and concerned citizen, I intend to be vigilant and alert on the matter of responsible regulation of the food choices we are given. I urge you to uphold the highest level of integrity in making your decisions on behalf of all citizens and consumers.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA’s preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mr. Thomas Carroll

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are not safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible. In fact, for people like me with arterioscleroses, that intake needs to be zero.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed. On the other hand, campaniles will do anything to save a buck. I hope the FDA will grant very few extensions and these should be advertised to the public so we know to avoid their products.

Thank you for considering my views and my health.

Sincerely,

Mrs. Noelene Johnsson

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Ms. Sheila Conboy
I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mr. Rob Bower

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,
Mrs. Kimberly Terrenoire

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mrs. Jessy Barron

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mrs. Morgen LaCroix

Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Ms. Laura Maguire

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Ms. Anna Hill

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mrs. Joan Rupp

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mrs. Joanna Cotter

Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

Dear Commissioner Hamburg,

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods, AND in popular packaged cookies, such as MALLOMARS and CHOCOLATE COVERED GRAHAM CRACKERS!

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Joan Formisano, Ed.D.

The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Ms. Maura Kelley

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I am a father to 7 children. We do our best to feed our family with healthy foods sourced locally whenever possible. We homeschool our children and thus do not expose them to school cafeteria food. But it is extremely difficult to avoid the vast amount of industrial driven food products that are known, linked, or thought to be linked with long term health problems. Any progress we have in removing clearly dangerous food products that were created by chemists to extend shelf life, reduce cost, or improve appearance at the expense of our health is something I support.

Thus, I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Ms. jean block

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mr. Ed Wainio

The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,
Mrs. Sheilah Schumann

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mrs. Jennifer Barbara

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

We cannot afford to continue letting millions of citizens eat food that knowingly causes illness and disease. The FDA should be much more rigorous and straight forward in working to eliminate dangerous foods and chemicals. Trans Fats need to go. They are not safe.

I am very very happy with your declaration- a great start!

Let's get these oils out of all our foods!

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mr. John Leinen

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mrs. Jane Merkel

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,
Mr. Norbert Izworski

The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,
Mrs. Joanne McGrath

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Ms. Caryn Cowin

Margaret Hamburg

Subject: Docket No. FDA-2013-N-1317

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,

Mr. Lammot Pont

As the agency has acknowledged, eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. The FDA's preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that time frame it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my views.

Sincerely,
Ms. Renate Ryan-Jeppeson

Dear Margaret Hamburg,

Division of Dockets Management (HFA-305)
Food and Drug Administration
5630 Fishers Lane
Room 1061
Rockville, MD 20852
Docket No. FDA-2013-N-1317

As someone with considerable background in health and nutrition, I strongly support the Food and Drug Administration's preliminary determination that partially hydrogenated oils are no longer generally recognized as safe.

In keeping with current scientific research, the FDA has acknowledged that eliminating the artificial trans fat that comes from partially hydrogenated oils could prevent between 10,000 and 20,000 heart attacks and 3,000 to 7,000 heart disease deaths annually. Its preliminary declaration is also in line with the recommendation of the Institute of Medicine, which reported that there is no safe level of trans fat and that intake should be as low as possible.

While restaurants and food manufacturers have made dramatic progress in eliminating partially hydrogenated oils from many foods, the ingredient still lurks in microwave popcorn, frosting, cakes and pies, and in some restaurant foods.

As the FDA has indicated, the cost to remove the remaining partially hydrogenated oil from the food supply is small ($8 billion) compared with the potential health benefits ($117 to $242 billion).

I urge the FDA to notify industry that it must complete the elimination of artificial trans fat in the next 6 to 12 months. If a company is unable to complete the transition in that timeframe it may seek an extension from the FDA, but finalizing the prohibition on the use of partially hydrogenated oils should not be delayed.

Thank you for considering my message.

Sincerely,
Ms. Diana Biro
